

For unstructured data, **Vector embeddings** is  
a form of automatic feature engineering.

Let's  
break  
it  
down!

Think of it as an array  $[0, -2, \dots, 4]$

Why? Vectors in a vector space help understand relationships in data, eg. closer vectors are related, further are not.  
(we will understand more...)

How?

To convert data to vectors we use

**Embeddings model**

↓  
pre-trained models which have a defined vector-space. Give them my data and it will just add to its space.

Again, why?

One relationships are established,  
your unstructured data has

— **MEANING** —

Now you can search not only for words but because it's in vector space it looks for distance in the vector space.

So, if you embed your data with OpenAI's embeddings, chatGPT can now understand what your document means!

\* It's like talking in GPT's language!

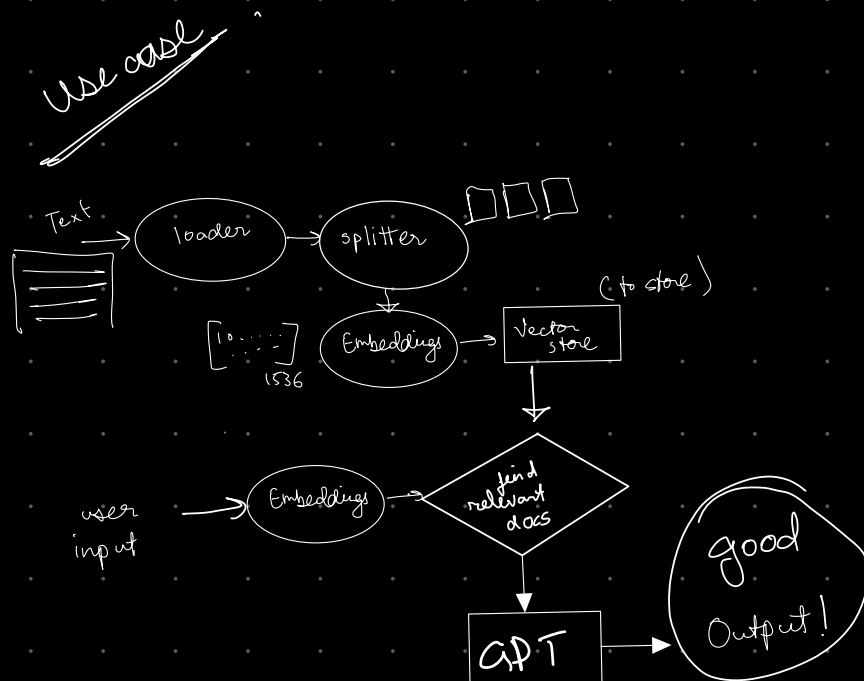

But still  
why?

① GPT is sometimes stupid!  
That's why.

You can train it on your  
own data and tell it do  
stuff from your own data!

② Cost effectiveness:

"Open" AI is expensive, you can  
create your own vector store and  
do a semantic search find relevant  
docs to a question and send only  
those to the model to answer  
as well!

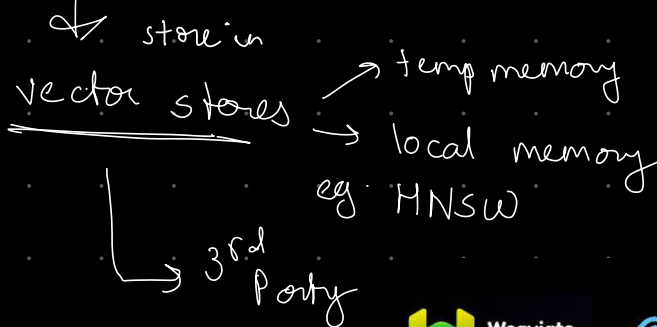

Good Theory , How to make IRLT

for GPT,

OpenAI  
Embedding  
model

```
import openai
response = openai.Embedding.create(
    input="positive pale say",
    model="text-embedding-ada-002"
)
print(response)
{
  "data": [
    {
      "embedding": [
        -0.0108,
        -0.0107,
        0.0323,
        ...
        -0.0114
      ],
      "index": 0,
      "object": "embedding"
    }
  ],
  "model": "text-embedding-ada-002",
  "object": "list"
}
```

OpenAI's  
embeddings  
model
